/ Determination of the nuclear magnetic moment of  $\text{Hg}^{199}$  and also the hyperfine structure of the mercuric iodide 5461-A line. Ion Arghireanu, Nicolas Ionesco-Pallas, Vasile Drăgănescu, Nicolas Comaniciu, and Vasile Tatu (Inst. At. Phys., Bucures-Milgurele, Romania). *Compt. rend.* 250, 317-18 (1960).—A previous measurement of the magnetic moment (cf. *CA* 52, 2526c) was reevaluated and the work was repeated with new equipment to eliminate some of the exptl. errors. A value of  $\mu_{\text{N}} = 0.506 \text{ n.m.}$  was obtained; this agrees well with the values obtained by magnetic resonance. The interval factor obtained was  $A(^1\text{S}_1) = 0.7166 \text{ cm.}^{-1}$  for  $\text{Hg}^{199}$ . Arnold Friedman—

Lovpin (Timisoara Prov.) have shown that in  
Bucharest Prov sugar beets ought to be sown as  
early as possible. The average harvest yield  
under these sowing conditions was 193 cwt/ha.  
The sowing of sugar beets should also be carried  
out early at Cluj Prov. A delay in sowing produced  
a considerable reduction in root and sugar yields.  
In Jassy Prov. sowing should be extended to about  
three weeks. Vernalization of the seeds some-  
times increased the root harvest by 14%. Better  
results through early sowing are also reported  
from Timisoara. Seed vernalization resulted in

Blair (WB) medium. Tests were conducted on 19<sup>4</sup> samples of feces of typhoid or suspected typhoid and on 33 samples of recuperative or bacteria-isolating patients. Inoculations from enriched media were made 18-20, 48 hours, and 7 days after cultivation. In 51 positive cases, inoculations from MK medium were made in 5-8 hours. Altogether 90 positive results were obtained; from the medium with 0.4% sodium selenite, positive results were obtained in 91.1% of cases; from the medium with 0.2% sodium selenite in 87.7%, from MK medium in 74.4%, and from broth in 57.7%. Inoculation directly on WB medium produced 86.6% viability. Optimal period for cultivation on MK medium was 5-8 hours, on other enriched media 18-20 hours. The authors recommend inoculation on media

toxicății alimentare produse de stafilococ. Alimentary intoxica-  
tions caused by staphylococci ARH. ROMINE EPIDEM. MICRO-  
BIOL., STUD. CERCET. 1956, 1 (191-197) Tables 1

The authors describe 2 epidemics of alimentary origin caused by staphylococci, one following ingestion of pre-cooked sausage, the other resulting from cream cakes. From the sausage and from the nasal and pharyngeal secretions of the staff who had prepared this food, a haemolytic staphylococcus aureus was isolated. In the second intoxication, a haemolytic staphylococcus albus was isolated from the cake. The enterotropic properties of toxin extracts obtained from various sources have been demonstrated by intraperitoneal and intra-venous inoculation in cats.

A new medium for trypsin digestion in the preparation of staphylococcal toxin ARH. ROMINE EPIDEMIOLOG. MICROBIOL., STUD. CERCET. 1956, 1 (492-497)

The authors obtained a very active staphylococcal toxin by the use of a medium in which commercial peptone is replaced by a product of trypsin digestion following Hottinger's method. The anatoxin derived from this toxin has a high antigenic value and it produces local and general reactions much less marked than those provoked by the anatoxin prepared with other media. It can be purified by alcohol, and then gives a higher production than that obtained with the commercial peptones. With the same medium a highly active entero-toxin may also be obtained.

95. COMBIESCU C. Raspândirea tipurilor bacteriofagice de Salmonella typhi în R.P. România intervalul 1953—1954 *Incidence of bacteriophagic types of S. typhi in the Rumanian People's Republic during the years 1953—1954* Microbiol. Parazitol. Epidemiol. 1956 1/2 (40—46) Graphs 10 Tables 1

The most widely spread types of *S. typhi* are: A, E<sub>1</sub>, F<sub>1</sub> and D<sub>1</sub>. Type E<sub>1</sub> is almost uniformly distributed throughout the country; others (C and N), predominate in certain regions; the distribution of type O is limited to one region. The non-typifiable strains are fairly frequent and attain a percentage of 38 in certain regions. The usefulness of the determination of the bacteriophagic type for the study of typhic epidemics is confirmed. However, in 24 % of the cases a reduction of the isolated strains during convalescence with a development towards heterosensitive or Vi-negative strains was observed.

Sechter — Iasi (IV, 17)

EXCERPTA MEDICA Sec 4 Vol 12/1 Med. Micro. Jan 59

114. THE FREQUENCY OF BIOCHEMICAL TYPES AMONG PHAGE TYPES OF S. TYPHI, ISOLATED IN ROUMANIA - L'incidence des types biochimiques parmi les types bactériophagiques de S. typhi, isolés dans la République Populaire Roumaine - Combliescu C. and Meitert Th. Inst. de Microbiol., Parasitol. et Epidémiol., Bucarest - J. HYG. EPIDEM. MICROBIOL. IMMUNOL. (Prague) 1957. 1/3 (329-337) Graphs 1 Tables 2

Biochemical and phage types were determined for 426 strains of S. typhi isolated in Roumania. The strains belonged to the following phage types: A (116), C (13), D<sub>1</sub> (51), D<sub>2</sub> (3), E<sub>1</sub> (42), F<sub>1</sub> (25), F<sub>2</sub> (3), O (6), N and DN (23), undetermined (96), degraded Vi (24) and negative Vi (24). Fermentation was tested with arabinose, xylose, D-tartrate and citrate. Some phage types (C, D<sub>1</sub>, E<sub>1</sub>, F<sub>1</sub>, O) were biochemically homogeneous whereas others could be sub-divided: type A into 11 subgroups, and the undetermined degraded Vi and negative Vi phage groups into 5-7 subgroups. The use of fermentation reactions combined with phage typing may constitute a valuable contribution to epidemiology. Benzoni - Milan

Title : Influence of Some Fungicides on Seeds of Vegetable Plants

Orig Pub : Anuarul lucrar. stiint. Inst. agron. Craiova, Bucuresti,  
1957, 339-348

Abstract : Formation,  $\text{CuSO}_4$  solutions, and mercuric chloride (in various concentrations) were used in the treatment of seeds of the pepper, cucumber, onion, tomato, and cabbage against phytopathogenic microorganisms transmitted by the seeds. High concentrations of mercuric chloride depressed germination of the treated seeds, and lower concentrations were not effective against the microorganisms;  $\text{CuSO}_4$  had no effect on the germination of seeds of the cucumber and cabbage.
